J. BACTON: CURLIN IS THE STRUCTURAL SUBUNIT OF THE CURLI. CURLI ARE COLIDED SURFACE STRUCTURES THAT ASSEMBLE PREFERENTIALLY AT GROWTH TEMPERATURES BELOW 37 DEGREES CELSIUS. CURLI CAN BIND TO FIBRONECTIN. THE MINOR SUBUNIT IS THE NUCLEATION COMPONENT OF CURLIN MONOMERS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SEQUENCE FROM N.A.

Biotechnol. Biochem. 58:762-764(1994).

-! FUNCTION: Ice nucleation proteins enable bacteria to nucleate crystallization in supercooled water.

-! SUBCELLULAR LOCATION: Outer membrane.

-! SUBCELLULAR LOCATION: Outer membrane.

-! DOMAIN: CONTAINS IMPERECT REPEATS OF A CONSENSUS OCTAPEPTIDE A-G-Y-G-S-T-X-T; FURTHER ON A 16-RESIDUE AND A REGIONAL 48-RESIDUE PERIODICITY IS SUPERIMPOSED.

-! MISCELLANGOUS: A STRUCTURAL MODEL IS SUGGESTED IN WHICH THE ICE NUCLEATION PROTEIN DISPLAYS A SYMMETRY RELATED TO THAT OF ICE.

-! SIMILARITY: Belongs to the bacterial ice nucleation protein
                                                                                                                                                                                                                                                                                                                             77 NNRAKVDQ---AGNYNFAYIEQTGNANDASISQSAYGNSAAIIQKGSGNKANITQY 129

"The consensus sequence of ice nucleation proteins from Erwinia
"The consensus sequence of ice nucleation proteins syringae.";
Gene 85:239-242(1989).
-!- FUNCTION: Ice nucleation proteins enable bacteria to nucleate
crystallization in supercooled water.
-!- SUBCELLULAR LOCATION: Outer membrane.
-!- DOMAIN: CONTAINS 126 IMPERECT REPEATS OF A CONSENSUS OCTAPEPTIDE

-!-FUNCTION: Ice nucleation proteins enable bacteria to nucleate crystallization in supercooled water.

-!-SUBCELLUIAR LOCATION: Outer membrane (By similarity).

-!-DOMAIN: CONTAINS 153 IMPEREGY REPRAINS OF THE CONSENSUS OCTAPERTIDE A-G-Y-G-S-T-L-T; FURTHER ON A 16-RESIDUE AND REGIONAL 48-RESIDUE PERIODICITY IS SUPERIMPOSED.

-!-MISCELLANGOUS: A STRUCTURAL MODEL IS SUGGESTED IN WHICH THE ICE NUCLEATION PROTEIN DISPLAYS A SYMMETRY RELATED TO THAT OF ICE.

-!-SIMILARITY: Belongs to the bacterial ice nucleation protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     45;

The rickettsial outer membrane protein A and B genes of Rickettsia australis, the most divergent rickettsia of the spotted fever group.";
Submitted (MAY-1999) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: THE 120 kDa SURFACE-EXPOSED PROTEIN IS A MAJOR
STRUCTURAL PROTEIN WHICH MAY PLAY A ROLE AS A RICKETTSIAL VIRULENCE FACTOR AND/OR IMMUNOGEN DURING INFECTION (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (By similarity).
-!- SUBCELLULAR LOCATION: Cell wall. This bacterium is covered by a S-
layer with hexagonal symmetry (By similarity).
-!- SIMILARITY: BELONGS TO THE RICKETTSIAE OMPA/OMPB FAMILY.
                                                                                                                                                                                                                                                                           OMPB RICCN STANDARD; PRT; 1655 AA.

-I-FUNCTION: REQUIRED FOR SURVIVAL AND DIFFERENTIATION OF FEMALE GERM LINE CELLS. PLAYS A ROLE IN GERM LINE SEX DETERMINATION.

-I-SUBCELLULAR LOCATION: Nuclear (Potential).

-I-DEVELOPMENTAL STAGE: FIRST APPEARS IN THE GERMARIUM AND ACCUMULATES IN NURSE CELLS DURING OGGENBEIS. STORED IN THE EGG, BUT IS RAPIDLY LOST IN THE EMBRYOS EXCEPT FOR ITS CONTINUED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Garfinkel M.D., Wang J., Liang Y., Mahowald A.P.;

"Three distinct RNAs for the surface protease gp63 are differentially expressed during development of Leishhania donovani chagasi promastigores to an infectious form.";

"Elol. Chem. 267:1888-1895(1992).

-! FUNCTION! Has an integral role during the infection of macrophages in the mammalian host.

-! CATALYTIC ACTIVITY: Preference for hydrophobic residues at Pl and Pl' and basic residues at P2 and P3'. A model nonapeptide is cleaved at -Ala-Tyr-|-Leu-Lys-Lys-|-COPACTOR: Binds 1 zinc ion per subunit (By similarity).

-! SUBSELLUIAR LOCATION: Attached to the membrane by a GPI-anchor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       LEISHWANOLYSIN.

Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epicope or antigen. Also described are: (1) use of thin aggregative fimbriae (SEFI7/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, CsgA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene back into the chromosome of the homologous species, replacing the native

copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or dilutent. (1) is useful for the expression of recombinant AgfA protein which is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbhrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present invention describes a recombinant agfA gene (1) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative finbriae (SEPI)/TARF) mucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, CSA and AgfA, homologue fimbrin shunits, respectively, (2) directing recombination of a recombinant gene into the chromosome of the homologue species, (3) directing recombination of a recombinant gene back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment of segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or comprising separating in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for the animal in conjunction with a carrier or diluent (1) is useful for the expression of recombinant AgfA protein which is useful for the retrologous antigens are presented in high numbers (up to Sou,000 copies/Cell), the hybrid finbrin protein possesses both the immunelly properties relevant for an efficient live immunogenicity and adhesion properties relevant for an efficient live
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ,

assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and Enterbacteriaceae for the production of fimbriae comprising recombinant of a fracting recombination of a recombination of a recombinant gene into the chromosome of the homologous species, replacing the native compositions species, (3) directing recombination of a recombinant gene back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant Agfa protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. Coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant Agfa protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial submit proteins are usually strong immunogens, which may be important for directing an immune response in manned the present invention in inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SDARKSETTITQSGYGNGADYDQLVTRVVTHEMAHAFRNNATIDQWNAKNSDITVGQYGG 120

                                                                                                                   The present sequence represents agfA encoded by the full agfA gene derived from Salmonella enteritidis 27655-3b. The nucleic acid can be used to provide diagnostic assays for Salmonella and/or enteropathogenic bacteria of the family Enterobacteria. It can also be used to provide proteins and antibodies which can be used for assays. The nucleic acid sequence can be used to provide probes or primers which can specifically hybridise to nucleic acid molecules from greater than 99% of Salmonella strains that are pathogenic to warm-blooded animals relative to nucleic acid molecules from virtually all other microbial organisms. (Updated on 25-MAR-2003 to correct PF field.)

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA consequence which encodes a foreign entopop or antigen. Also described are: (1) use of thin aggregative fimbriae (SEPI7/TAF) nucleation depended assembly system of strains of Salmontella, Escherichia coli and consequence of the production of fimbriae comprising recombinant of a recombinant gene into the chromosome of the composition of a recombinant gene into the chromosome of the homologous species, (3) directing recombination of a recombinant gene copy of that gene; and (4) eliciting an immune response in an animal, copy of that gene; and (4) eliciting an immune response in an animal, copy of that gene; and (4) eliciting an immune response in an animal, comprising separating a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, B. coli or Enterobacteriaceae host cell, from the host cell and introducing the correction of recombinant AgfA protein which is useful for useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrim protein possesses both the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response community the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the horseon the recombinant of the recombinant of the recombinant of the recombinant of the recombinant of the recombinant of the recombinant of the recombinant of the recombinant of the recombinant of the recombinant of the recombinant of the recombinant of the recombinant of the recombinant of the recombinant of the recombinant of the recombinant of the recombinant of the

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA segment of the necdess a foreign epitope or antigen. Also described are: (1) use of thin aggregative finbried (SETI/TAP) nucleation depended assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and directing recombination of finbrials comprising recombination of directing recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of the native copy of that gene; and (4) eliciting an immune response in an animal, copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a replacement segment or segments of foreign amino cortaining a replacement segment or segments of foreign amino cortaining a replacement segment or segments of foreign amino cortaining a replacement segment or segments of foreign amino cortaining an expansion of recombinant AgfA protein which is useful for the expression of recombinant AgfA protein which is useful for system the heterologous antigens are presented in high numbers (up to system the heterologous antigens are presented in high numbers (up to system the heterologous antigens are presented in high numbers (up to vaccine, the carrier fimbrial submuit protein are usually strong immunogens, which may be important for directing an immune response conception of the present invention manual sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                            Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                           Disclosure; Page 138; 139pp; English

Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.

English. Disclosure; Page 139; 139pp;

The present invention describes a recombinant agfA gene (1) where a segment of a foreign bNA segment of the gene has been replaced by a segment of a foreign bNA segment of the gene has been replaced by a segment of a foreign bNA sequence which encodes a foreign epitope or antigen. Also described are:

CC (1) uses of thin aggregative fimbriae (SETIJ/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant commologue fimbrin subunits. respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologous species, respectively; (2) directing species, (3) directing recombinant gene into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or cardiecral containing a replacement segment or segments or dilutent. (1) is protein containing a replacement segment or active or dilutent. (1) is cuseful for the expression of recombinant AgfA protein which is useful for useful for the expression of recombinant AgfA protein which is useful for system the heterologous antigens are presented in high numbers (up to 500,000 copies/Cell), the hybrid fimbrina are usually strong immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogenicity and adhesion properties relevant for an efficient live companient, the inserted epicope, and hybrid dimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are:

(1) use of thin aggregative fimbriae (SEF1/TAR) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprision recombinant dark. CsgA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombinant denomologues species; (3) directing recombinant gene homologous species; (3) directing recombinant gene back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal; comprising separating an amino acid polymer comprising are combinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and nurroducing the protein containing a replacement segment or segments of coli or acid sequence or sequences grown on a Salmonella, E. coli or Interobacteriaceae host cell, from the host cell and nurroducing the polymer into the animal in conjunction with a carrier or dilutent. (I) is useful for the expension of recombinant AgfA protein which is useful for useful for the retrier fimbrial submit protein possesses both the system the heterologous antigens are presented in high numbers (up to 500,000 cophes/cell), the hybrid fimbriae are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 MKLLKVAAFFAAIVVSGSALAGVVPQWGGGGNHNGGGNSSGPDSTLSIYQYGSANAALALQ 60

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epicope or antigen. Also described are: (1) use of thin aggregative finbriae (SEPI)/TAP) nucleation depended are: (2) use of thin aggregative finbriae (SEPI)/TAP) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant CG Buterobacteriaceae for the production of fimbriae comprising recombinant con composines species, (3) directing recombination of a recombinant gene composition species; (3) directing recombination of a recombinant gene composition species; (3) directing recombinant confirmed sequence of the homologous species, replacing the native comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino composition of the composition of a sequence or sequences grown on a Salmonella, E. Coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is collymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful cellciting an immune response in an animal. In a finbrial presentation system the heterologous antigens are presented in high numbers (up to coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or coll or

It is a species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                120
                                                                                                                                                   SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQYDQ 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (I) use of thin aggregative fimbriae (SETI7/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and AbfA, CspA and AgfA-homologue fimbrine subunits, respectively; (2) directing recombinant gene into the chromosome of the homologue species; (3) directing recombinant gene into the chromosome of the homologue species; (3) directing recombination of a recombinant gene
                                                                                                           9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen, Also described are:
                                                                                                                                                                                                                                                                                                                                               ü
Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (1) useful for the expression of recombinant AgfA protein which is useful eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to $500,000 copiess/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier finbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given it the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MKLLKVAAFAAIVVSGSALAGVVPQWGGGGNHNGGGNSSGPDSTLSIYQYGSANAALALQ

assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant control of a recombinant gene into the chromosome of the homologous species, replacing necombinant gene back into the chromosome of the homologous species, replacing of the chromosome of the homologous species, replacing neman; or comprising separating an aimon acid polymer response in an animal, comprising separating an aimon acid polymer comprising are comprising a replacement segment or segments of foreign animo acid polymer comprising a separating an amino acid polymer comprising a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a finbrial presentation system the heterologous antigens are presented in high numbers (up to 100,000 copies/cell), the hybrid fimbrin protein possesses both the immunogens, which may be important for directing an immune response in an immune response in an immune response in an immune response in an immune response in an immune response in a manual in the present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SEPIJ/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enerotacterizacae for the production of fimbriae comprising recombinant of Enerotacterizacae for the production of fimbriae comprising recombinant of a recombinant gene into the chromosome of the homologue important gene comprising separating a recombinant gene into the chromosome of the homologus species, replacing the native comprising separating an amino acid polymer comprising a recombinant of the comprising separating an amino acid polymer comprising a recombinant of comprising separating an amino acid polymer comprising a recombinant of the comprising separating an amino acid polymer comprising a recombinant of comprising a replacement sequence of sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (T) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the hererologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein are usually strong immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial submit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are usually strong inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            o;
                                          Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9

The invention relates to an isolated peptide capable of binding a mammalian plasma protein or of generating an immune response in a mammal selected from sequences shown in ABR82642, ABR82648-49. The peptide or antibody is useful for treating a bacterial infection in a human or animal or in the manufacture of a medicament for the prophylactic treatment of a bacterial infection, such as Escherichia coli, Salmonella or Shighla infection. The peptide that is immobilized on a solid support is also useful as a reagent for determining the ability of a plasma protein to bind to bacteria. The present sequence represents an E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated peptide capable of binding a mammalian plasma protein, useful in the manufacture of a medicament for the prevention and/or treatment of a bacterial infection, such as Escherichia coli, Salmonella or Shigella infections.
      Plasma protein; immune response; antibacterial; vaccine; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Disclosure; Page 41-42; 42pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbries (SEFIT/TAP) nucleation depended assembly system of strains of Salmonella Escharichia coli and comparation of strains of Salmonella Escharichia coli and adgregate the production of fimbriae comprising recombinant contracting recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene into the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer comprising a replacement segment or segments of foreign amino comparising separating an amino acid polymer comprising a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino containing a nation and salmonella, E coli or Enterobacteriace host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is consecut for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to conjunction, the carrier fimbrial subunit proteins are usually strong mumunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier of pubric fimbriae are easy and conjuncted the present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                             Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       65.7%; Score 509; DB 3; Length 151; 68.2%; Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 3
